

## The problem it solves

Many people struggle to decide what to eat every day while also finding recipes that match their dietary preferences, fitness goals, or available ingredients. This tool helps users quickly generate personalized meal plans and provides recipes for each meal, making meal planning easier and more convenient.

## The key features

- 1-Ask the user for basic information such as fitness goal (weight loss, muscle gain, maintenance), dietary preferences, number of days, and available ingredients (optional).
- 2-Generate a personalized meal plan using the Gemini API based on the user's preferences and goals.
- 3-Allow the user to select any meal from the generated plan to receive a complete recipe, including ingredients, cooking instructions, estimated cooking time, and approximate calories.
- 4-Prioritize recipes that use ingredients the user already has when available.
- 5-Display the meal plan and recipes clearly in the terminal.
- 6-Save the generated meal plan and recipes as a .txt or .pdf file for future reference.

## The constraints (what it should NOT do)

- 1-Should not provide medical, nutritional, or dietary advice only generates meal suggestions based on the user's input.
- 2-Should not guarantee that calorie estimates or nutritional information are completely accurate.
- 3-Should not create meal plans longer than a reasonable period (for example, more than 7 days) to keep the project simple.
- 4-Should not automatically generate grocery orders or connect to external shopping services.
- 5-Should not support user accounts, databases, or meal history—each session is independent.
